

# The grinding-active brush roller SVG-2 type

## What does a "grinding-active" brush roller mean?

On conventional convoluted and foamed rollers the non-woven material will be foamed out with PU-foam. This PU-foam contains no abrasive material. It only serves to increase the service life.

On our "grinding-active" brush roller SVG-2 type, we have additionally managed to add grinding-active materials. Hereby the grinding performance and service life will be highly increased.

- Excellent deburring and grinding performance
- Extremely high service life

**This guarantees you a very good price-performance ratio.**

## Your advantages:

- An equal roughness during the entire durability
- No residues in the holes (especially important on blind via-holes)
- Exact true running
- No unbalances, therefore good care of the machine bearings

## Operational areas:

- Deburring printed circuit boards after drilling
- Removing resin residues after compression
- Processing of mikro-vias
- Mechanical cleaning prior to solder mask
- Preparation of the surface for further work-steps after plug-in grinding
